## Crypto Market Short Coin (CMSC)

### Introduction

The crypto market as of today is highly volatile and unregulated. Investors have opportunities to make exponential gains but also have the risk to lose a lot of money within a few minutes. This volatility is a big chance and a big risk at the same time.

As of today, it is very simple to benefit from the exponential gains by just buying coins but it is not so easy to benefit from market corrections or crashes or even to secure the portfolio against losses and crashes.

The aim of the **Crypto Market Short Coin (CMSC)** is to give investors an opportunity to bet against the coin market and to secure the gains made in the past during a dip or crash. Therefore, we developed a unique smart contract that dynamically increases or decreases the total supply of coins depending on the coin market cap.

In addition, the **Crypto Market Short Coin Panel (CMSC Panel)** allows holders to actively bet their CMSC against other coins and get rewards, if the market cap of the targeted coin drops.

This document will give you an overview on how this coin works.

### The Coin

The crypto market short coin is an ERC 20 Token based on Ethereum. The value of the coin will be determined by the market once the coin will be listed at several exchanges. The aim will be to be listed on as many exchanges as possible.

### Coin Sale via Smart Contract

Starting supply: 100 Mio coins

Starting price: 0.00008 ETH (1250 CMSC per 0.1 ETH, ~ around 0.06 USD per CMSC)

Early investors will receive a bonus of 20% (reserved for the first 50 investments of 0.1 ETH or higher)

20% of the coins are reserved for management, maintenance, and marketing activities.

The ICO will be stopped once the coin will be tradeable on one of the major exchanges. We target to sell only a limited amount of the CMSC total supply before getting listed on an exchange.

## Dynamic coin supply based on Crypto market cap

The CMSC Smart Contract is designed, that it automatically burns a percentage of its own supply, while the total market cap of the Crypto market drops. This shortening of supply makes every single CMSC more valuable and shall lead to an increase in price.

The Crypto market cap (and the total supply of CMSC) will be updated on a regularly base (based on data from coinmarketcap.com). The adjustment of supply is equivalent to the change of the Crypto market cap, which means that if the total Crypto market cap goes down by 10%, the CMSC supply in the contract will also reduced by 10%. Of course an increase on the Crypto market cap will also lead to an increase of tokens. The current Crypto market cap and total supply are stored in the smart contract and are always transparent.

This mechanism combined with the trust people put into the system should ensure the coin will increase value during a dip or crash compared to other coins.

## Betting CMSC against other coins

The Crypto Market Short Coin also provides a betting mechanism, which allows you to actively bet your CMSC against other coins. If the market cap of the targeted coin drops within the specified time, you will earn additional CMSC as a reward. Once again, the rewards earned are equivalent to the change of the market cap of the coin (as provided by coinmarketcap.com). If it drops by 20% you will receive a 20% reward on your bet amount. If it rises by 10%, you will only receive 90% of your initial bet amount back.

All bets are stored and handled within the Blockchain: Transparent, secure and unchangeable. For now, the betting system is free to use. You will only have to pay the transaction into the Blockchain (a very little amount of ether). The Crypto Market Short Coin Panel allows you to create new bets and review already placed ones.

The screenshot shows the 'Make a Short Bet' interface on the Cryptomarket Shortcoin website. The interface is divided into a dark sidebar on the left and a main content area on the right. The sidebar contains navigation links: 'Back to Website', 'Dashboard', 'Buy CMSC', 'Get free CMSC', 'Transfer CMSC', 'Make a Short Bet' (highlighted), and 'Overview Bets'. The main content area displays the account address '0xffab154e92600b408c1e30160c72be8c9a6c3ab3' and a balance of '12500 CMSC'. The 'Make a Short Bet' section is marked as 'beta' and asks 'Which coin do you want to short (bet against)?'. Three options are listed: 'Ripple (XRP)' (selected), 'Bitcoin Cash (BCH)', and 'Litecoin (LTC)'. Below this, it asks 'Which is the designated time interval for the bet?' and shows a dropdown menu set to '3 days: Sunday, 04.03.2018 20:00:00h CET'. The final question is 'Which amount of CMCS do you want to bet?', with a current account balance of '12500 CMSC' and a bet amount of '2750' entered. A slider below the input field shows the bet amount relative to the account balance, with markers at '0 CMSC', '2 750 CMSC', and '10 000 CMSC'.

## Chances and Risks

Since this coin does not add any additional value to the user it can only work if people trust in the mechanism of increasing value during a dip or crash. The risk is, that the market loses this trust and the value goes to zero. The chance is, that with the trust of the people we can establish a real asset for crashes and dips and people can limit their losses in these situations.

## Limits of Liability

We will honor our commitment to our investors and thrive to maximize the value of their investment. We cannot though be held liable to a decrease in the funds value due to unforeseen circumstances or theft. We will though do our utmost to avoid such circumstances.

This is an investment with high potential return but also some risk. Accordingly, the investment is at your own risk and you should only commit as much money as you can handle losing.
